Description

Query Match Length DB

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate cancers.

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itse can be used as a vaccine for the treatment of prostate cancer. The I was identified by analysis of a subtracted CDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

PS Claim i; Page 66-67; 114pp; English.
CC secreted protein (see W58380). It was isolated from a human adult cretina cDNA library using methods selective for cDNAs that encode cc secreted proteins. The clone is deposited in composite clone antigens. Novel cDNA clones (see V3933) is designed to isolate cthe clone from the composite. The predicted AT415_4 amino acid contidens. Novel cDNA clones (see V3933) is designed to isolate composite clone from the composite. The predicted AT415_4 amino acid contidens. Novel cDNA clones (see V39033) is designed to isolate clone from the composite. The predicted AT415_4 amino acid contidens. Novel cDNA clones (see V39033) is designed to isolate clone from the composite. The secreted proteins for analysis, cc characteristation, diagnostic or therapeutic use. They can also be used as tissue or moliwt markers, for chromosome identification, contentify genetic disorders, to isolate new related DNA, as sources of primers for PCR, to generate antibodies, and in contentify genetic disorders, to isolate new related DNA, as sources of primers for PCR, to generate antibodies, and in continification activity, chemotactic or chemokinetic activity, activing antibodies and thrombolytic activity, receptor/ligand activity, activing antibodies and thrombolytic activity, receptor/ligand activity, can also be continification activity. The proteins can be expressed in conform DNA, introduced in gene therapy vectors.

Compared to the gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion compared to the human protein only.

Compared to the human protein only.

Compared to the human protein only.

Compared to the human protein only and their fragments (nucleic acid sequences: V34154-V34276; amino acid sequences W75057-W75179) which care useful for preventing, treating or ameliorating medical conditions can be considered by determining the amount of the new polypoptides in a sample cor by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 70 polynucleotides, based on which tissues they are most highly expressed in (see V34154 for described conservibles).

Clone HPWARD5 is a member of the TMASF receptor superfamily. The products generated using the receptor can be used for treating abnormal conditions related to both an excess of and insufficient amounts of receptor activity. They can be used in the treatment of e.g. immune disorders, cancers, blood disorders, juvenile rheumatoid arthritis, Graves disease or immunocompromised disease states. The products can also be used for detection and diagnosis.

Fig. Human fumour-associated antigen PRAT - useful for stimulating cell proliferation and screening for antagonists useful to treat or prevent cell proliferation disorders e.g. cancers S Disclosure; Fig la-1C; 54pp; English.

CC This is the nucleotide sequence of the human tumour-associated antigen CC (PRAT) used in the method of the invention for stimulating cell ccell proliferation and screening for antagonists useful to treat or prevent CC cell proliferation disorders such as cancer, and genetic defect e.g. csickle cell anaemia. The polypeptides can be combined with a suitable carrier in pharmaceutical compositions, and also used to screen for antagonists, agonists, and to generate antibodies. PRAT agonists can be added to a cell to stimulate cell proliferation by increasing or combined with a suitable carrier in pharmaceutical compositions, which cc associated with cell proliferation, especially cancers. Antibodies specific for PRAT may be used directly as antagonists, or indirectly as a targeting or delivery mechanism to bring pharmaceutical agents to pray expression and to monitor therapeutic interventions. Novel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers

Claim 1; Page 42; 141pp; English.

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate protein.

Dillon DC, Xu J;
Polypeptides comprising immunogenic portions of prostate protesused in a vaccine for the treatment of prostate cancer Claim 3; Page 41; 130pp; English.

The present sequence is a new DNA which encodes an immunogenic of a prostate tumour protein. The encoded immunogen, or the DNA can be used as a vaccine for the treatment of prostate cancer.

was identified by analysis of a subtracted cDNA library obtaine subtracting a prostate tumour cDNA expression library with a not tissue cDNA library.

Novel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers
Claim 1; Page 42; 141pp; English.
This sequence represents a human prostate tumour specific gene, and car be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by

The present sequence is a new DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itsecan be used as a vaccine for the treatment of prostate cancer. The invariant of a subtractine by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.
